Empathy Map Canvas: Insurance Claims Adjuster

What does he THINK AND FEEL?

- "I have way too many claims to review today."
- "Is this claimant telling the truth, or are they hiding something?"
- *Feels overwhelmed* by the massive backlog of pending cases.
- *Worries* about accidentally approving a fraudulent claim and costing the company thousands of dollars.

What does he HEAR?

- Honest customers complaining: *"Why is my payout taking so long?"*
- Management demanding: *"We need to reduce our fraud losses this quarter."*
- Other investigators talking about sophisticated, hard-to-catch fraud rings.

What does he SEE?

- An endless digital dashboard of pending insurance claims.
- Suspicious patterns in accident reports (e.g., single-vehicle accidents at 2 AM with no witnesses).
- Inconsistent damage photos and potentially forged documents.

What does he SAY AND DO?

- *Does*: Spends hours manually cross-checking police reports, policy details, and customer history.
- *Does*: Calls customers, witnesses, and authorities to verify minor details.
- *Says*: "I need more time to investigate this claim before we can approve the payout."

PAIN (Fears, Frustrations, Obstacles):

- Manual verification is incredibly slow, tedious, and prone to human error.
- High stress from angry customers who are waiting for their legitimate payouts.
- It is extremely difficult to spot hidden or complex fraud patterns with the naked eye.

GAIN (Wants, Needs, Measures of Success):

- **Needs:** An automated tool to instantly flag suspicious claims.
- **Wants:** To process legal, honest claims instantly without manual review.
- **Success:** High accuracy in catching fraud, saving the company money, and clearing the claim backlog faster.
